MPsrch\_pp Run on: protein - protein database search, using Smith-Waterman algorithm Tue Sep 26 16:16:03 2000; MasPar time 9.87 Seconds 731.891 Million cell updates/sec

Tabular output not generated.

Title: >US-09-308-435-2 (28-260) from US09308435.pep

Description: Perfect Score:

Sequence: 1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Scoring table: PAM 150 Gap 11

Searched: 85661 seqs, 30989116 residues

Post-processing: Minimum Match 0% Listing first 45

summaries

Database: swiss-prot38 l:swissprot

Statistics: Mean 48.589; Variance 103.194; scale 0.471

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(28-260) from US09308435.pep
1599
1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Scoring table: PAM 150 Gap 11

Searched: 188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq36 1:geneseqp

Statistics: Mean 32.470; Variance 175.985; scale 0.185

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This polypeptide comprises a 29 kDa surface antigen which is compressed on the surface of both dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori, and is also a putative virulence factor. The invention relates to a new pharmaceutical composition comprising a lipid aggregate of a negatively charged lipid or lipid mixture and at least one engatively charged lipid or lipid mixture and at least one antigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see V34643) coding for such an antigen. The new formulations, which are useful as vaccine formulations, elicit a protective immune response against H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second, claimed 29 kDa antigen (see W60156) is provided that differs only at residue 222 (Ser for Arg).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28-MAY-1998.

PS Claim 6; Page 28-30; 51pp; English.
CC This polypeptide comprises a 29 kba surface antigen which is
CC expressed on the surface of both dividing (bacillary) and resting
CC (colloid) forms of Helicobacter pylori. The antigen gives rise to
CC both systemic and local (mucosal) production of antibodies. It is
CC and is also a putative virulence factor. The invention relates to
CC and is also a putative virulence factor. The invention relates to
CC anew pharmaceutical composition comprising a lipid aggregate of a
CC negatively charged lipid or lipid mixture and at least one
CC the surface-exposed 29 kDa antigen of H. pylori, preferably
CC coding for such an antigen. The new formulations, which are useful
as vaccine formulations, elicit a protective immune response
CC against H. pylori infections, and are suitable for therapeutic and
CC against H. pylori infections, and are suitable for therapeutic and
CC against H. pylori infections, and are suitable for therapeutic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   prophylactic use. An adequate response is produced even wided adjuvant. A second 29 kDa antigen (see W60157) is provided differs only at residue 222 (Arg for Ser).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB; V34642.

Aggregate of negatively charged lipid and Helicobacter pyloriantigen - useful in therapeutic or preventative vaccines again both forms of bacterium, to generate systemic and mucosal ant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LO-DEF-1998 (first entry)
Helicobacter pylori 29 kDa surface-exposed antigen.
Cell surface antigen; adhesin; infection; vaccine; drug delivery.
Helicobacter pylori.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Berglindh T, Lofroth WPI; 98-312174/27.

Claim 2; Page 34-35; 49pp; English.

Claim 2; Page 34-35; 49pp; English.

Claim 2; Page 34-35; 49pp; English and dividing forms of the surface of resting and dividing forms of the bacterium. It is conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43835) differs only at position 222 (Arg for Ser). Recombinant cantigen can be produced in transfer dost cells. It is useful for the diagnosis and treatment of H. pylori infections and for use as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

             Recombinant or substantially pure preparations of H. pylori polypepti are disclosed, together with the nucleic acids encoding them. In all, 73 ORFS are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at legent and the proteins or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the fusion protein of the invention, between the H. pylori adhesin gene, and the V. cholerae toxin A2 and B subunit genes This protein is used in the diagnosis of and as a vaccine against H. pylori, which is the main cause of gastritis and gastric/duodenal ulcers. It may also be used in the production of an anti-H. pylori antibody. Vectors containing the DNA sequence and E. coli strains containing if form the basis of a process to produce the protein, which consists of culturing the microorganism and obtaining the protein. The protein is an effective vaccine against H. pylori due to its excellent immunogenicity for H. pylori, stability within the stomach environment, and its ability to penetrate through the stomach mucous membrane to stimulate strains and the strains the strains the strains to settlement t

Bisclosure; Page 1363-64; 1481pp; English.

This sequence represents a H. pylori protein.

This sequence represents a H. pylori protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds; useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified CC and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               닭
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents an H. pylori derived protein, no further details are given in the specification.

Chearils are given in the specification sequences of the invention of the invention of the sequences.

Chearils are given in the specification of sequences, and corresponding proteins are considered to useful for generating vaccines for immunising subjects against H.

Chearils are given in the sequences, and corresponding proteins, are considered for generating vaccines for immunising subjects against H.

Chearils are given in the sequences, and corresponding proteins, are considered for inhibit expression of a gene from Helicobacter species in the sample.

Chearils are given in the sequences of these sequences are considered by a fragments were blunt-ended and ligated to unique complementary to the BstXI-cut pMPX vectors, while the overhang is not complementary. Therefore the linkers will not concatemerise nor construct a series of shotgun subclone libraries. The purified DNA samples were then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

PT Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter; Disclosure, Page 625; 1481pp; English.

The present sequence is a H. pylori derived protein, no further details are given in the specification.

The protein may be used in a vaccine to prevent or treat H. pylori C. The protein may be used in a vaccine to prevent or treat H. pylori C. Useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To condition the predicted coding regions defined by computer evaluation acid sequences predicted from various ORF were analysed for significant code and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide conduction, e.g. in E. coli hosts.

Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection Claims 14,80; Page 653; 1145pp; English.

This sequence is a H. pylori cell envelope outer membrane protein of the protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

DNA and probes derived from it may be used for the identification of the compounds of the identification of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      H. pylori ORF 01ae11010_40688_c2_38 cell envelope OMP. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
 Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection claim 14; Pages 558-559; 1145pp; English.

This sequence is a H. pylori protein of unspecified function. This sequence is a H. pylori protein to prevent or treat H. pylori The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. DNA and probes derived from it may be used for the identification on the pylori in a sample and the diagnosis of H. pylori infection. Nuclear the pylori in a sample and the diagnosis of H. pylori infection. Nuclear the pylori in a sample and the diagnosis of H. pylori infection. Nuclear the pylori in the pylori in the pylori infection.
                                                                                                                                                                                                           (ASTR ) ASTRA AB.

Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                           WPI; 98-542293/46.

New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases
Claim 8; Page 455-456; 2054pp; English.
This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating thelicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastriits, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (HUMA-) HUMAN GENOME SCI INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Y10951
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         secreted protein; ce Helicobacter pylori.

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Tabular output not generated. Tue Sep 26 16:20:02 2000; MasPar time 9.81 Seconds 735.665 Million cell updates/sec

Description: Perfect Score: Title:

Sequence: >US-09-308-435-4 (28-260) from US09308435.pep 1599 1 CSPHITETRANSPORT CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Scoring table: PAM 150 Gap 11

Searched: 85661 segs, 30989116 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot38 1:swissprot

Statistics: Mean 48.644; Variance 103.561; scale 0.470

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Sequence analysis of the CEN12 region of Saccharomyces cerevisiae on a 43.7 kb fragment of chromosome XII including an open reading frame homologous to the human cystic fibrosis transmembrane conductance regulator protein CFTR.";

I yeast 12:693-708(1996).

I regulator protein CFTR.";

C regulator protein CFTR."

C I SUBCIONAL COMPONENT OF THE ORIGIN RECOGNITION COMPLEX (ORC) THAT BINDS ORIGINS OF REPLICATION. IT HAS A ROLE IN BOTH CHROMOSOMAL REPLICATION AND MATING TYPE TRANSCRIPTIONAL SILENCING. BINDS TO THE ARS CONSENSUS SEQUENCE (ACS) OF ORIGINS OF REPLICATION.

C I-SUBUNIT: ORC IS COMPOSED OF SIX SUBUNITS OF 120 KDA, 71 KDA, 62 KDA, 56 KDA, 53 KDA AND 50 KDA.

Mol. Gen. Genet. 224:101-110(1990).

-I- FUNCTION: THIS METHYLASE RECOGNIZES THE DOUBLE-STRANDED SEQ COMEG. CAUSES SPECIFIC METHYLATION ON C-2 ON BOTH STRANDS.

-I- CATALYTIC ACTIVITY: S-ADENOSYL-L-METHIONINE + DNA CYTOSINE S-ADENOSYL-L-HOMOCYSTEINE + DNA 5-METHYLCYTOSINE.

-I- SIMILARITY: STRONG, TO OTHER C5-DNA METHYLASES.
